

Course code	21AMAA33C	MATHEMATICAL METHODS	L	T	P	C
Core/Elective/Supportive		Core	3	1	-	4
Pre-requisite	Basic concepts of calculus, initial value problems, boundary value problems and linear transformations		Syllabus Version		2021-2022 onwards	
<b>Course Objectives:</b>						
The main objectives of this course are to:						
<ol style="list-style-type: none"> <li>1. Introduce the basic concepts and knowledge about different types of integral equations and its applications.</li> <li>2. Gain the key concept of popular and useful transformations techniques like Fourier transform and Hankel transform.</li> <li>3. To lay a broad foundation for an understanding of the problems of the calculus of variations and its various methods and techniques.</li> </ol>						
<b>Expected Course Outcomes:</b>						
On the successful completion of the course, student will be able to:						
1	Familiarize and understand the Volterra and Fredholm integral equations and their solutions using various methods.					K1
2	Solve simple IVP and BVP by using calculus of several variables.					K4
3	Apply techniques of Integral transform to formulate and solve complex problems of differential equations.					K3
4	Solve the equations involving functional and parametric form.					K2
5	Solve applied problems of science and engineering by using learned mathematical methods.					K5, K6
<b>K1 - Remember; K2 - Understand; K3 - Apply; K4 - Analyze; K5 - Evaluate; K6 - Create</b>						
<b>Unit:1</b>	<b>Integral Equations</b>				<b>12 hours</b>	
Introduction: Integral equations with separable kernels - Reduction to a system of algebraic equations, Fredholm alternative, an approximate method, Fredholm integral equations of the first kind, method of successive approximations - Iterative scheme, Volterra integral equation, some results about the resolvent kernel, classical Fredholm theory - Fredholm's method of solution - Fredholm's first, second, third theorems.						
<b>Unit:2</b>	<b>Applications of Integral Equations</b>				<b>12 hours</b>	
Application to ordinary differential equation - Initial value problems, boundary value problems - Singular integral equations - Abel integral equation.						
<b>Unit:3</b>	<b>Fourier Transforms</b>				<b>12 hours</b>	
Fourier Transforms, Fourier sine and cosine transforms – Fourier transforms of derivatives - convolution integral – Parseval's Theorem - Solution of Laplace Equations by Fourier transform.						
<b>Unit:4</b>	<b>Hankel Transforms</b>				<b>12 hours</b>	
Properties of Hankel Transforms – Hankel transformation of derivatives of functions - The Parseval's relation – relation between Fourier and Hankel transforms - Axisymmetric Dirichlet problem for a half space - Axisymmetric Dirichlet problem for a thick plate.						
<b>Unit:5</b>	<b>Calculus of Variations</b>				<b>12 hours</b>	
The method of variations in problems with fixed boundaries: Variation and its properties - Euler's equation - Functionals of the form $\int F(x,y_1,y_2,\dots, y_n,y_1',y_2',\dots,y_n')dx$ , Functionals dependent on higher order derivatives – Functionals dependent on the functions of several						

independent variables - Variational problems in parametric form - Some applications.

<b>Unit:6</b>	<b>Contemporary Issues</b>	<b>2 hours</b>
---------------	----------------------------	----------------

Expert lectures, online seminars - webinars

<b>Total Lecture hours</b>	<b>62 hours</b>
----------------------------	-----------------
